by: March 15, 2010

HVAC Systems for Custom Homes

Forget everything you know about air distribution and HVAC systems! The rules for designing custom homes are not the same as the rules for spec houses. Get a glimpse into the "art" of achieving premium thermal comfort in large living spaces. We will discuss air distribution, convection cells, register grilles and diffuser sizing and placement, designing ductwork for noise, radiant floor heating and warming, as well as the energy efficiency and applicability of the available system types including high efficiency "hydro-air," geothermal heat pumps and high efficiency VRV systems.

Instructor

Mike Zimmerman, PE has over 30 years of experience in the design of mechanical systems for commercial, industrial and residential buildings, as well as construction project management, project development, design review, and value engineering. Mr. Zimmerman is a professional engineer, LEED accredited professional, a certified energy manager, and a certified plant engineer.

Our first seminar on Geothermal Heat Pumps was a great success!
Reserve your spot today as space is limited. Attendees will be selected on a first come, first serve basis.
